**Remarks:** The minimum value in euros of the treatment that the DWLF-Helpers have rendered to the needy among the population is realistically calculated (in the opinion of many of the aid workers) as follows: Total of Check-ups (determination of general condition, state of dentition, therapy planning, etc.) correlates to the number of patients. For extractions figure on: 20% X1, 30% X2, 25% X3, 25% Ost 1, with use of 50% nerve block anesthesia and 50% infiltration anesthesia. For fillings figure on: 10% F1, 20% F2, 40% F3, 30% F4; for F2, F3, and F4: 75% with Cp; for F3 and F4: 80% with special measures, using 20% nerve block anesthesia and 80% infiltration anesthesia in laying the fillings. Plaque removal, also with scaling... Sealing is calculated per tooth according to IP5. Oral treatment in 5% of cases, group- or individual prophylaxis: 30% of patients reached is estimated as individual prophylaxis. Root fillings, et sim. under Other. The point values of the primary insurer in the lawfully recognized health insurance agencies in Germany are taken as basis. Composite fillings with UV light and layering techniques are expensive private procedures; these are not assessed. In any event, we get a result that is below the actual performance of the DWLF-Helpers and are incontestable, but yield a statistic that can be compiled. The statistics listed have been compiled to the best of our knowledge and belief.
